AI usage report

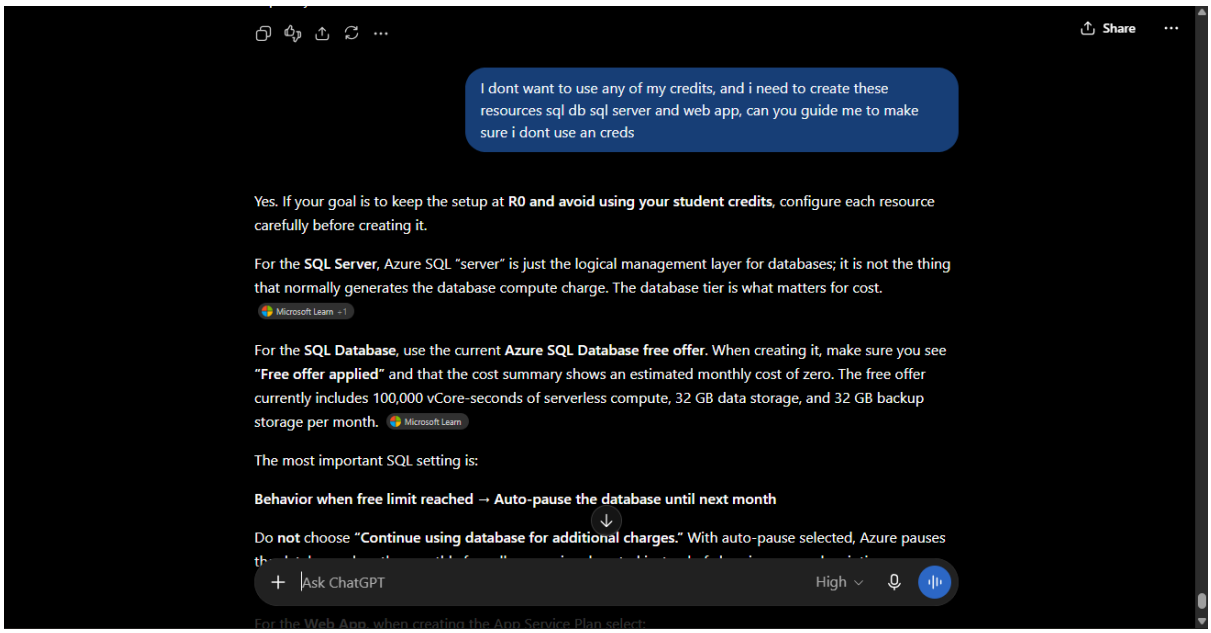

ChatGPT was used to help us understand how to implement SSO with Firebase, as our lecturer was unable to go over this concept in class with us. ChatGPT was therefore also used to help us implement SSO. Below shows how I used ChatGPT to explain the concept of SSO and how to implement it.

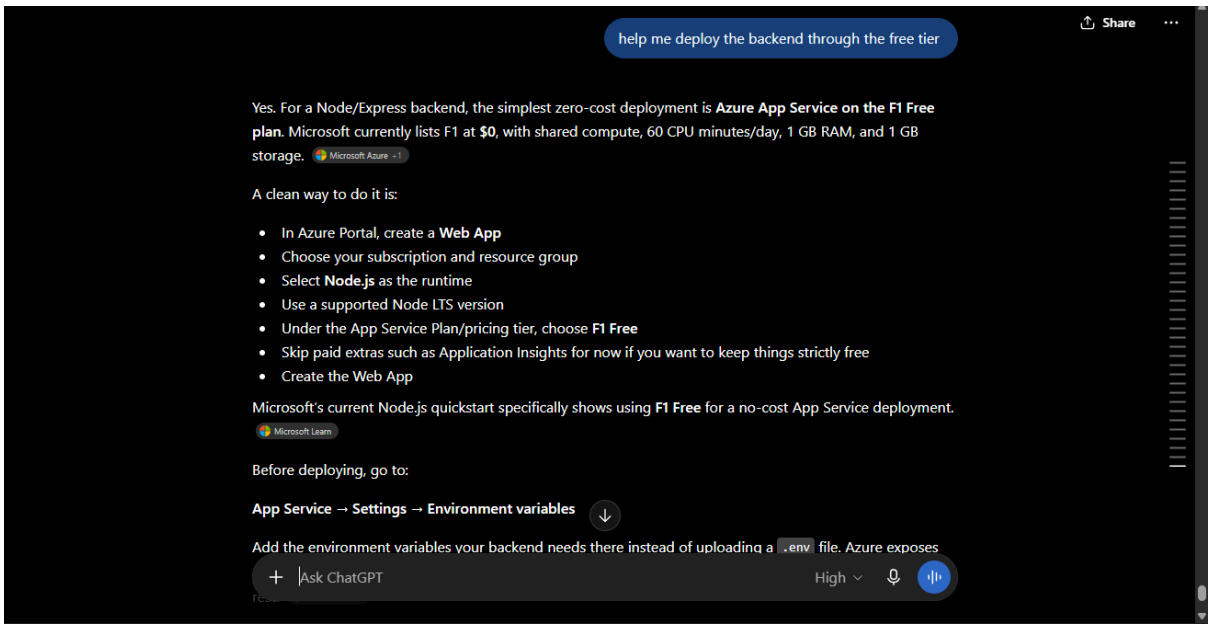

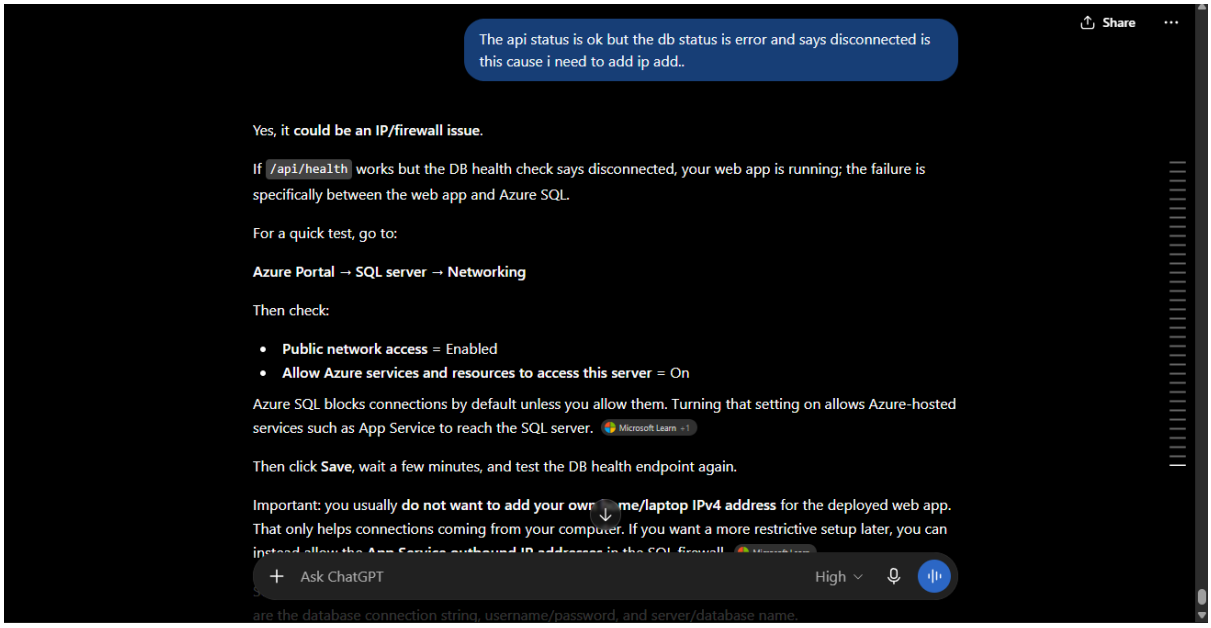

ChatGPT was used to help navigate Azure, configure the free tier hosting, deploy the backend API, and troubleshoot Azure SQL.

help me deploy the backend through the free tier
Yes. For a Node/Express backend, the simplest zero-cost deployment is **Azure App Service on the F1 Free plan**. Microsoft currently lists F1 at **$0**, with shared compute, 60 CPU minutes/day, 1 GB RAM, and 1 GB storage.
Microsoft Azure +1
A clean way to do it is:
In Azure Portal, create a **Web App**
Choose your subscription and resource group
Select **Node.js** as the runtime
Use a supported Node LTS version
Under the App Service Plan/pricing tier, choose **F1 Free**
Skip paid extras such as Application Insights for now if you want to keep things strictly free
Create the Web App
Microsoft's current Node.js quickstart specifically shows using **F1 Free** for a no-cost App Service deployment.
Microsoft Learn
Before deploying, go to:
App Service → Settings → Environment variables
Add the environment variables your backend needs there instead of uploading a .env file. Azure exposes

The api status is ok but the db status is error and says disconnected is this cause i need to add ip add..
Yes, it **could be an IP/firewall issue**.
If /api/health works but the DB health check says disconnected, your web app is running; the failure is specifically between the web app and Azure SQL.
For a quick test, go to:
Azure Portal → SQL server → Networking
Then check:
Public network access = Enabled
Allow Azure services and resources to access this server = On
Azure SQL blocks connections by default unless you allow them. Turning that setting on allows Azure-hosted services such as App Service to reach the SQL server.
Microsoft Learn +1
Then click **Save**, wait a few minutes, and test the DB health endpoint again.
Important: you usually **do not want to add your own me/laptop IPv4 address** for the deployed web app. That only helps connections coming from your computer. If you want a more restrictive setup later, you can
